Thank you for choosing TANDBERG!
TANDBERG video conferencing offers the natural communication experience of a face-to-face meeting in ways that other technologies cannot.
Your TANDBERG MXP video endpoint has been designed to give you many years of safe, reliable operation.
This user guide has been divided into several chapters, all of which provide different information. You can access the chapters directly by clicking on the menu bar at the top of this page.
You will find that some places information has been copied from other chapters (but adapted, when needed) to let you have all the relevant information there and then. This helps eliminating the need to read through long sections before you can even think of getting started.
Our main objective with this user guide was to address your goals and needs. Please let us know how well we succeeded!
Chapter 1
Getting started

In this chapter...
► Waking up the system
► Remote control details
► Navigating in the menus
► Entering text in text fields
► Selfview
► Controlling your own camera
► Screen layout
► Camera presets
► Using the screen as PC display
► Standby
► The icons on the screen
Waking up the system

To make a call you need to wake up the system from standby. However, if someone calls you, the system will wake up by itself.

The navigation principles of your TANDBERG system are presented here and on the following pages.

Pick up the remote control

- To wake up the system just pick up the remote control or press any key. You may have to point the remote control towards the system to make it discover you.
- The system will now show the welcome screen, which contains the main menu and it will display the main camera image in the background.
- The IP number (whenever applicable) and the system name are displayed in the upper right corner.
- The IP number is the dial-in number of your system.
- The screen will also indicate if there are any calls you have missed.

Navigation basics

Remote control details are presented on the next page, but here are a few basic principles.

- The Arrow keys in the center of the upper part of the remote control are used to navigate in the menus. There is an orange frame on the screen indicating the element currently selected. Press OK to select.
- In the main menu, pressing Cancel will hide the menu. To bring it back, press OK.
- In other menus Cancel will take you one step back.
- In an input field pressing Cancel will delete characters/numbers to the left of the cursor position.

If the system fails to respond

Should the system fail to respond to the remote control or to incoming calls, make sure that:

- The system is connected to line voltage
- The remote control has working batteries.

Even incoming calls wake up the system!

The system is in standby mode whenever it is not used. The screen is then black.
Any incoming call will wake up the system when in standby.
There are some restrictions to this if the Do not disturb function has been activated.
Remote control details

Don’t let the number of keys on the remote control confuse you. The system is quite simple…

The upper part of the remote control is used to handle the video part of the call...

...while the lower part of the remote control resembles very much the keypad of a mobile phone.

Arrow keys are used to navigate in the menus. Press OK to show the menu and to select menu items.

Press the **Call** key to place a call.

Use the **Phone Book** to store and recall video contacts for easy placement of calls.

Use the **End Call** key to end the current call. Pressing this key when not in a call will put the system in Standby mode.

Pressing this key when not in a call will put the system in Standby mode.

You may predefine camera positions to be used during a call. Presets do not apply to systems with fixed or manually moved cameras.

Switch to a predefined presentation source. If the key is held down for 1 second then the Presentation video sources menu will appear.

Turn your microphone on and off.

Adjust the volume.

Toggle between full screen and different display layouts.

Display your outgoing video. Press again to return.

Takes you back one step in the menu system, i.e. to leave a menu undoing any changes. Use the key to delete characters in an input field. Press and hold the key for 1 second to close the menu.

Zoom the camera in and out.

Take a snapshot, but only during a call.

Press **Touch tones** when you are in a call and need to dial extension numbers etc. Press the **OK** button to exit **Touch tones**.

You may predefine camera positions to be used during a call. Presets do not apply to systems with fixed or manually moved cameras.

Switch to a predefined presentation source. If the key is held down for 1 second then the Presentation video sources menu will appear.

Turn your microphone on and off.

Adjust the volume.

Toggle between full screen and different display layouts.

Display your outgoing video. Press again to return.

Takes you back one step in the menu system, i.e. to leave a menu undoing any changes. Use the key to delete characters in an input field. Press and hold the key for 1 second to close the menu.

Zoom the camera in and out.

Take a snapshot, but only during a call.

Press **Touch tones** when you are in a call and need to dial extension numbers etc. Press the **OK** button to exit **Touch tones**.
Navigating in the menus

Your TANDBERG system is operated by means of the remote control. All you need to know to get you up and going are a few basic navigation principles.

If there is no menu shown...

Wake up the system by lifting the remote control. Otherwise, press the OK key to produce the menu, if needed.

The remote control

The upper part of the remote control is used to handle the video part of the call...

...while the lower part of the remote control resembles very much the keypad of a mobile phone.

Getting started

Basic navigation principles...

The orange frame indicates the icon currently selected.

Use the four Arrow keys to navigate between icons in a menu.

Moving about the menu using the Arrow keys...

The OK key is used to enter the submenu of an icon.

The three ways of leaving a menu...

Save. Select this icon and press OK to leave menu putting changes into effect.

Cancel. Select this icon and click OK to leave menu undoing any changes.

Restore default. Select this icon and click OK to restore default settings.

Entering submenus...

Once you have navigated to a topic of interest, press OK to select that topic. You will then enter the corresponding submenu.

Submenus provide further choices and options, as shown below. The cursor position (the menu item selected) is again indicated by an orange frame:

Autoanswer

Some choices consist of radio buttons. Use the Arrow keys to navigate and press OK to select a setting.

All menu items having an arrow appended allow you to go further down the hierarchy and enter another submenu:

Press the OK key to go further down in the hierarchy.
Entering text in text fields

Some menu fields expect text information to be entered. Apart from the need to enter the number or identity of the person you want to call, you will also—among other things—need this ability to search and maintain your list of contacts in the phone book.

What happens when you press a number key?

- Pressing a number key outside calls will produce the Call menu.
- Once positioned inside an entry field expecting text entries, the system automatically switches to text mode (ABC). Entering letters is similar to as on a cellular phone—see right.
- Once positioned inside an entry field requiring number entries, the system automatically switches to 123 mode allowing numbers to be dialed with the number keys as usual.

Using the number keys in text fields

Whenever text entries are expected by the system, a small abc or ABC appears in the right lower corner of the entry field. For entry fields expecting numbers, 123 will appear instead. In text mode, entries from the number keys are automatically interpreted as text entries in the same way as on a cellular phone.

Guidelines:

- Press the key that corresponds to the required letter as many times as needed to produce that letter.
- Switch between lower case (abc) and upper case (ABC) letters with the # ai/A key.
- Switch between text mode (abc) and number mode (123) by keeping the # ai/A key depressed for more than a second.
- To insert space, press the 0 _ key.
- To insert the @ sign, press the 1 -key twice, while the keypad is in text mode.
- To insert the . sign, press the 4 -key once, while the keypad is in number mode.
- To write digits and numbers in a text input field, repeatedly press the corresponding key until the digit appears.

Example: How do I write Alice 123 in the Search input field in the phone book?

Do as follows:

1. Press the 2 -key once to get an A.
2. Press the # -key once to switch between upper case and lower case letters.
3. Press the 5 -key three times to get an l.
4. Press the 4 -key three times to get an i.
5. Press the 2 -key three times to get a c.
6. Press the 3 -key twice to get an e.
7. Press the 0 -key once to get space.
8. Press the 1 -key three times to get a 1.
9. Press the 2 -key four times to get a 2.
10. Press the 3 -key four times to get a 3.

The type of entry expected is shown here as either abc, ABC or 123.
Terminology used

There are few terms in need of a proper definition:

About Selfview
In this user guide, the term Selfview means the outgoing image. In a normal video call using the main camera, this will be the image of yourself. The Selfview button toggles the images between Far End, Selfview and Dual Video Stream (if applicable).

About Point-to–point and MultiSite
The term point-to–point refers to a video meeting with no more that two parties, while the term MultiSite, refers to a video conference consisting of several participants.

About near end and far end
In a point-to–point video call, your side is the near end and the other party represents the far end.

If you are a part of the blue team, this side of the video call will be the near end...

...the orange team will then be the far end for you.

The terms near end and far end will be used consistently throughout this user guide.

About dual video stream
Your video system supports the use of dual video streams in video meetings. This means that you can transmit and receive things like PC presentations and DVD footage during the video meeting, in addition to the usual video signal you receive and transmit. Dual video stream is an optional feature.

The wonderful thing about this is that it opens up for presentations of things made with tools that require PC-software only used by specialists. One example could be the results of geological surveys in the oil business. A survey result presentation can be important for crucial decision making, but how do you show this to people located thousands of miles apart?

The answer is simple; hook up your PC to the video system, set it up for dual video stream and give your presentation as the second video stream!

Details about dual video stream usage can be found in the article Dual video stream.

The exact look of the screen during a dual video stream session is determined by the Screen layout.

Where is that Selfview key?
The Selfview key is located just below and to the right of the Arrow keys:

Using Selfview outside calls...

Pressing the Selfview key will switch between the near end video and a blank screen (or a logo, if uploaded by your administrator) on the main monitor.

Using Selfview in a point-to–point call without dual video stream...

In a point-to–point call, press the Selfview key once to switch from far end video to near end video to see a full screen picture of the outgoing video. Press Selfview again to go back to normal.

Using Selfview in a point-to–point call with a dual video stream...

In a point-to–point call with a dual video stream, the duo video is displayed in the big picture. Press the Selfview button to toggle to the near end picture, then the far end picture, and finally back to the second video stream.

The far end displayed

The near end displayed

The second video stream displayed
Controlling your own camera

The TANDBERG meeting room video systems have cameras that can be controlled from the remote control. Some video systems, however, do not have cameras controllable from the remote control. These are the TANDBERG Centric 1000 MXP, TANDBERG Tactical MXP, TANDBERG Compass/Utility, and TANDBERG Centric 1700 MXP.

- The TANDBERG Centric 1000 MXP, Compass, and Utility have fixed cameras that cannot be moved. Focus can, however, be adjusted manually.
- The TANDBERG Tactical MXP and Centric 1700 MXP both have a camera that can be moved up and down. Focus is adjusted manually even on these.

Controlling your own camera...

Press the Cancel key to remove the main menu from the screen, if needed...

… and use the four Arrow keys to move the camera to the left, right, up and down.

Controlling cameras at both ends

During a call you may control your own camera at all times by means of the Arrow keys as long as no menu is shown on the screen.

When you are in a point-to-point call you may also be able to control the far end camera, provided that the far end system has a remotely controllable camera.

How to do this is explained in Using far end camera control in the Video meeting features chapter.

Since the term far end will loose its meaning in MultiSite meetings, this feature is not available unless you are in a point-to-point call.
Defining camera presets

Sometimes there are many persons in the room during a video meeting. To make the person speaking easier to see it can be a good idea to zoom in on that person. To make the zoom-in somewhat faster and more elegant, you may employ the predefined camera presets feature. These presets contain information about in which direction the camera should point as well as about the zoom setting. This is something you typically will prepare before the video meeting starts.

The feature applies to endpoints with cameras that can be controlled from the remote control only. Consequently, camera presets are NOT available for:

- TANDBERG Centric 1000 MXP
- TANDBERG Centric 1700 MXP
- TANDBERG Tactical MXP
- TANDBERG Compass/Utility

For the other MXP endpoints a total of 15 presets (0–14) can be defined.

During a video meeting the far end may get access to your camera presets and utilize them ad libitum, see ► Using far end camera presets, which can be found in the chapter ► Video meeting features for more on this.

This works the other way around as well. Even if your system has a manually adjustable camera only, you may still be able to control any camera presets available at the far end.

The far end camera presets control feature is not accessible in ► MultiSite video meetings, since the term far end will lose its meaning when there are more than two parties in a call.

Using the camera presets

How to use the camera presets is described in ► Using near end camera presets, which can be found in the chapter ► Video meeting features.
Screen layout
The layout of the screen can either be shown as Picture In Picture (PIP) or Picture Outside Picture (POP) when displaying more than one video image. For widescreen monitors, POP is recommended. The behavior of the Layout key depends on how your administrator has set the Picture Layout setting in Control Panel > Screen Settings.

Auto layout
Luckily you won’t have to worry, the system will automatically choose the best layout for your call. This is referred to as Auto layout.
You can, however, always change layout manually with the Layout key. The auto layout applies when you open or close a dual video stream, or when you add or disconnect participants.
Auto layout also includes automatic PIP. That implies that PIP will be shown when suitable, e.g. to display selfview when you move your near end camera. The automatic PIP times out after a couple of seconds.
Deactivated (set to Off) means no automatic layout changes during a call—you must manually control the images with the Layout key. Auto layout is by default active. To deactivate the auto layout you must go to Control Panel > Screen Settings.

The control panel settings are part of the administrative settings of this product. They are described in the Administrator Guide, which can be found on the CD that accompanied your TANDBERG product. Alternatively, the guide can be downloaded from www.tandberg.com.

The administrative settings of this product may have been password protected by your administrator.

Depending on the number of participants in your video meeting and whether you use a dual video stream or not, some of the locations of the screen layouts may differ or be empty. The actual positioning of each picture as you press the Layout key, may vary from the above examples.

Picture in Picture (PIP)
When Picture Layout is set to PIP, the Layout key makes it possible to see a second image in a smaller view in one of the corners of the screen. The second image will be placed on top of the main image. You are free to choose in which corner the second image is to be displayed (press the Layout key repeatedly).
Example of PIP (Picture in Picture).

Picture outside Picture (POP)
When Picture Layout is set to POP, the Layout key makes it possible to see up to three images in a composition optimized for wide screens. The second image can be displayed either as a side-by-side the main image (1+1) or smaller images next to the main image (1+2 and 1+3).
Press the Layout key once to get a side-by-side view (1+1). Press again to get the layouts 1+2 and 1+3, and finally go back to full screen view. You can also go back to full screen directly by pressing and holding Layout for 1 second.
Example of POP (Picture outside Picture).
Getting started

Using the screen as PC display

If you want to use the video system screen as your PC screen, we recommend that your system administrator sets Use Screen as Local PC monitor to On. How to do this is described in the Administrator Guide for this product, which can be found on the CD accompanying this product.

This implies that you can display your PC locally while having a video conference, and you can keep on working without risking that the far end can see what’s on your PC screen.

We also recommend to have the Auto Layout setting set to On (default) to get a suitable layout when toggling from the local PC display mode to standard video conference mode.

Use the Selfview key to toggle between local PC display mode and standard video conference mode. An indicator tells you that your PC image is displayed locally.

A small example

Assume that you are using the system as a PC and get an incoming call, as shown in the illustration on this page.

When the setting Use Screen as Local PC monitor is On, you will keep your PC image displayed locally and the incoming call pops up in a Picture in Picture (PIP) or as smaller images in a 1+3 layout, depending on your system.

You will see your PC image displayed in the big picture and far end and/or near end (yourself) displayed in smaller pictures.

Press the Selfview key to switch to standard conference mode. The local PC image is no longer displayed and the far end is displayed in the big picture or full screen. Press Selfview again to see near end. Pressing Selfview a third time will bring back the local PC display mode.
Standby

The system will automatically go to standby mode when it is not in use. In standby mode, the screen(s) will turn black. It is, however, still possible to receive incoming calls.

The standby mode of the system should be enabled if the system is to be left idle.

Standby is not activated by switching off the power to the monitor(s). Some TANDBERG systems come with monitors that cannot be switched off.

If the system is set to be using the screen as PC display, the standby mode will be disabled when the system detects a video signal from the PC. When the PC video signal no longer is detected, the standby mode will be re-enabled.

Entering standby mode ...

Outside a call, press OK to produce the main menu, if needed, and navigate to the Standby icon. Press the OK key.

To enter standby mode here and now, navigate to the Standby Now icon and press the OK key.

However, if you instead want to postpone (delay) the standby for 1 hour or 3 hours, you should select one of the other icons before pressing the OK key.

The below example shows 3 hours delay highlighted (selected).

Select this icon to have standby postponed (delayed) by 1 hour.

Select this icon to have standby postponed (delayed) by 3 hours.

Leaving standby mode

When the system is in standby, pick up the remote control or press any key to activate the system again.
The icons on the screen

To help you immediately realize the present status of important actions, states, and events taking place, there is a number of icons appearing on the screen, whenever applicable.

Some of these may be turned off, if you so wish. This is done from the Control Panel > Icons.

Observe that the Control Panel settings may have been password protected by your system administrator.

Icons you may encounter on the screen …

**Microphone Off.** This indicator is shown when the microphone is turned off. Press the Mic off key of the remote control to toggle between On and Off.

**Volume Off.** This indicator is shown when the volume is turned off. Press Volume + to turn the volume back on.

**Telephone.** This set of indicators is shown when there also are telephone only participants in a multi site conference. Indications are given for 1, 2, 3 or more than 3 participants. Icons turn green when a telephone participant has the floor.

**Dual Video Stream.** Dual video stream activated is indicated by this icon.

**On Air.** When you have the floor in a MultiSite conference this is indicated by the On Air icon.

**Bad Network.** This indicator appears if the system detects network anomalies like packet loss, jitter etc., during a call. Open the menu by pressing the OK key and select the warnings icon to see details.

**Not Secure Conference.** This open padlock indicator is shown during the initialization phase for AES or DES encryption. During this period the call is not secure.

**Secure Conference, DES.** This padlock indicator is shown when DES encryption (Secure Conference) is active.

**Secure Conference, AES.** This double padlock indicator is shown when AES encryption (Secure Conference) is active.
Chapter 2
Making calls

In this chapter...
- Access codes
- Making calls by dialing the number
- Altering the call settings
- Making calls using the phone book
- Ending an ongoing call
- Answering an incoming call
- Streaming
- Calling two others at the same time
- Video conference basics
- Adding calls to a video conference
Access codes
Your TANDBERG system may, or may not, have been set up to require access codes to be typed in before a call can be made.

Access codes are used for two things:

- **Call restrictions.** These may be applied by installing a file of valid access codes that must be entered to permit calls to be made. This installation is typically made from TMS (TANDBERG Management Suite—available separately).

- **Billing opportunities.** Assume that an access code is needed whenever you make a call. Your company may have different access codes for the different clients of your company.

Then, the access code used may be picked up by TMS to generate statistics on who is calling whom, when, and for how long time.

This information may later form the basis for billing clients or departments. Observe that in this case there will be no strict need for installing an access code file on your system—TMS will still have access to the codes you have assigned to the calls. In this case any code entered will be considered valid.

Of course, the two applications may be combined to form a billing system with call restrictions. This will then become a system that acts as forced billing.

Access codes should be activated by your system administrator.

How to do this is described in the Administrator Guide which can be found on the CD that accompanied your TANDBERG video system.

When the system asks for access codes...

… this dialog box will appear, prompting you to enter a valid code:

![Access Code Dialog Box](https://via.placeholder.com/150)

Use the remote control to enter the code. Note that the system expects text entries, similar to when using a mobile phone to send text messages (sms)—see the text to the right for details.

Using the number keys in text fields
Whenever text entries are expected by the system, a small abc or ABC appears in the lower right corner of the entry field. For entry fields expecting numbers, 123 will appear instead. In text mode, entries from the number keys are automatically interpreted as text entries in the same way as on a mobile phone.

Guidelines:

- Press the key that corresponds to the required letter as many times as needed to produce that letter.
- Switch between lower case (abc) and upper case (ABC) letters with the # a/A key.
- Switch between text mode (abc) and number mode (123) by keeping the # a/A key depressed for more than a second.
- To insert space, press the 0 _ key.
- To insert the @ sign, press the 1 - key twice, while the keypad is in text mode.
- To insert the . sign, press the * - key once, while the keypad is in number mode.
- To write digits and numbers in a text input field, repeatedly press the corresponding key until the digit appears.
Making calls by dialing the number

Your TANDBERG system can make both video calls and telephone calls. Telephone calls over IP may require additional hardware and infrastructure. If in doubt contact your administrator or your TANDBERG representative.

Using the number keys in text fields

Whenever text entries are expected by the system, a small abc or ABC appears in the lower right corner of the entry field. For entry fields expecting numbers, 123 will appear instead. In text mode, entries from the number keys are automatically interpreted as text entries in the same way as on a mobile phone.

Guidelines:
- Press the key that corresponds to the required letter as many times as needed to produce that letter.
- Switch between lower case (abc) and upper case (ABC) letters with the # a/A key.
- Switch between text mode (abc) and number mode (123) by keeping the # a/A key depressed for more than a second.
- To insert space, press the 0 _ key.
- To insert the @ sign, press the 1 - key twice, while the keypad is in text mode.
- To write digits and numbers in a text input field, repeatedly press the corresponding key until the digit appears.

To make a call dialing the number...

… start by pressing the green Call key on the remote control...

… or select the Call icon of the main menu before you press OK key.

The Call menu is then displayed...

Enter the “number” here (it may consist of digits as well as letters) using the remote control.

Once you have finished entering the number, start calling by: ...

… pressing the green Call key on the remote control...

… or by navigating down to the green Call icon and pressing the OK key.

Instead of navigating down to the Call icon, you may also just press the OK key twice to start calling.

Switching between video and telephone calls

Before you make a video or telephone call, make sure the system call type is set up accordingly.

What type of calls the system has been set up to right now is indicated by a little icon to the left of the Call Settings field:

This icon shows that video calls are expected to be made.
This icon shows that telephone calls are expected to be made.

In order to change the setting, you must navigate to the icon:

Once there, press the OK key on the remote control to display the submenu:

Since the system in this example was set up for video calls, you must navigate down to Telephone call to change it, and press the OK key to put your change into effect.
Repeat the principle to select the other setting.
Altering the call settings

There are call settings available for you to specify the quality of the call. Calls will be set up with the default call settings if the settings are not altered. Whenever no alteration has been imposed, the Call Settings field will read Default Call Settings. If you alter the settings before calling someone, the field will show a text reflecting your changes. Usually there will be no need for you to alter the settings.

The default call settings are predefined in Call Quality > Default Call Settings of the Control panel. You may, however, redefine these settings from the Make a call menu, which is shown here.

If you want to alter the call settings before you call...

Navigate to the Call Settings field and press OK on the remote control...

The Call Settings menu will then be shown...

To gain access to the Net(work) settings, navigate to this and press the OK key to expand it. You will then have the following options:

- **Auto.** Leaves it up to the system to decide what to use (recommended).
- **ISDN.** For ISDN capable systems only.
- **H.323.** For H.323-based communication.
- **SIP.** For SIP-based communication.
- **System.** Defined by your administrator. Allows prefixes and suffixes for use with additional infrastructure equipment to be added automatically.

To gain access to the Bandwidth settings, navigate to this and press the OK key to expand it. You will then have the following options:

- **Auto.** Leaves it up to the system to decide what to use (recommended).
- **Defined by you.** Choose between 64, 128, 192, 256, 320, 384, 512 or 768 [kbps]
- **Max.** The highest rate possible.
- **Restrict (56K).** Used in the US to restrict the bandwidth whenever needed while communicating using ISDN.

Navigate to OK and press the OK key to leave the menu putting changes into effect, or to Cancel and press the OK key to leave menu undoing any changes made.

Set as Default. Once you have made a set of settings, you may let these settings become the default settings from now on.
Making calls using phone book

Making use of the phone book is time saving and prevents you from inadvertently calling the wrong number. The entries, often referred to as contacts, are sorted alphabetically. The contact names are displayed in the list and the telephone or video numbers of the selected contact will be displayed at the bottom line.

When selecting Phone Book, the phone book opens showing the folders Placed Calls, Missed Calls, Received Calls and My Contacts. There may also be a corporate phone book called Global Contacts. If so, such contacts will be listed below these folders.

To make a call using the phone book …

… start by pressing the Phone Book key on the remote control …

… or click on Call icon of the main menu …

… and then navigate to the Phone Book icon before pressing the OK key.

The phone book will then be displayed:

Entries with an arrow appended are expandable, press the OK key to display the expanded list.

Use the Arrow keys to navigate in the lists.

Once you have located whom to call, navigate down to that entry by means of the Arrow keys …

… and press the green Call key on the remote control to start calling the selected entry immediately.

Alternatives

Your video system has more than one way to operate the system.

Once you have navigated up or down to the entry to call in the phone book, you have the following options to call that entry:

- You can press the green Call key on the remote control, as described in the illustration on this page. This will make the system start calling the selected entry immediately.
- You can press the Left Arrow key to select the green Call Now icon in the left column. Press the OK key on the remote control to make the system start calling the selected entry immediately.
- You may key in letters using the remote control to search in the list. The more letters, the more narrow the result list becomes. Tips on how to key in letters can be found in Using the number keys in text fields on the previous page.

… or click on Call icon of the main menu …

… start by pressing the Phone Book key on the remote control …

… and then navigate to the Phone Book icon before pressing the OK key.

You may key in letters using the remote control to search in the list. The more letters, the more narrow the result list becomes. Tips on how to key in letters can be found in Using the number keys in text fields on the previous page.

Press OK to display the lists.

Press OK to display the lists.

Press OK to display the lists.

Press OK to display the lists.

Press OK to display the lists.
Ending an ongoing call

You end an ongoing call in the same way as you do when using a mobile phone by pressing the red End Call key on the remote control. This will produce the Call menu.

Switching off the monitor(s) using the power on/off switch on the monitor will not end an ongoing call. Some systems even come with monitors that cannot be switched off!

Ending an ongoing point-to-point call...

Press the End Call key or the OK key on the remote control...

This will cause the End Call dialog box to be displayed...

Then press the End Call key or the OK key on the remote control again...

Ending an ongoing MultiSite call...

Press the End Call key or the OK key on the remote control...

This will cause the End Call dialog box to be displayed...

Then press the End Call key or the OK key on the remote control again...

Ending MultiSite calls

Ending a MultiSite call can only be done by the host. The host is the party that initiated the video conference.

The other parties can disconnect themselves from the conference at any time, but they have no influence on the rest of the conference.

To end one or a few of the calls in a MultiSite video conference, navigate to the name of the call to be terminated and terminate that specific connection as if it were a simple point-to-point call.
Answering an incoming call

Answering an incoming call can be automated if you so wish, or you can have the system set up so that it requires that you physically accept the incoming call by pressing the green Call key on the remote control or the corresponding icon on the screen.

About incoming calls and privacy

You may want to set up your system so that the microphone is switched off whenever you receive an incoming call. The yellow Microphone Off key on the remote control can be operated to prevent callers from hearing you without your control. Press again to reactivate the microphone.

If the system is set up to automatically accept incoming calls with the microphone set to On, this is called setting Autoanswer to On. Your system may, however, be set up so that it automatically accepts an incoming call, but with the microphone switched off. This is called setting Autoanswer to On + Mic Off. This will require that you switch the microphone back on manually each time someone calls you.

To further increase the sense of privacy, you may also have your system set up so that you always must answer all incoming calls manually.

These settings are parts of the Control Panel Settings available. Your administrator may, or may not, have password protection activated to prevent unauthorized alterations of these and other settings. If in doubt, consult your administrator.

A message will be sent to the far end whenever you have disabled your microphone and/or your camera.

An alternative to this could be the use of the do not disturb feature (far right).

Using the Do Not Disturb

There is a do not disturb function available on your system. When set to On, all incoming calls are blocked from your system. Use the feature as follows:

1. Outside a call, press the red End Call key. In the menu then appearing, navigate to the Do Not Disturb icon:

   When someone calls you…

   … this menu is displayed on the screen of your video system:

   ![Call Status](Image)

   - Navigate to here and press the **OK** key to accept the call.
   - Navigate to here and press the **OK** key to reject the call.
   - Navigate to here and press the **OK** key to activate Do Not Disturb.

   This will not apply if Do Not Disturb already has been activated, nor will it apply if Autoanswer has been set to On or to On + Mic Off. See text for details.

   Alternatively, you may use the keys of the remote control directly:

   - Press the green Call key to accept the call.
   - Press the red End Call key to reject the call.

   If the microphone has been deactivated, press the yellow Mic off key to reactivate.

   2. Press the **OK** key to activate this feature. The screen will turn black and the text Press any key to clear Do Not Disturb will be shown.

   3. To reset the function, do just that (press any key).

   Let us assume that the do not disturb function has not been activated. Choosing Do Not Disturb (as shown to the left) when receiving an incoming call will then do two things: It rejects the incoming call (in the same way as choosing Reject), and sets the do not disturb functionality to On.

   If you activate Do Not Disturb whilst in a call, this will block incoming calls for as long as your call is going on.

   Whenever the do not disturb function has been activated, the far end will be informed that the called is busy.

Want a different video alert audio signal?

You are not stuck with the audio signal alerting you that an incoming call is on its way. This may be changed in the Audio Settings in the Control Panel section. Note that these settings may have been password protected by your administrator.
Streaming (I)
Streaming lets you broadcast your meeting to participants on the web. The web participants can view the meeting, listen to the meeting, see snapshots, but not participate themselves. Snapshots of current stream (available with MultiSite only), selfview, far end and dual video streams are accessible via http.

The streaming source setting is not available when streaming only is supported outside a call.

Setting up for streaming...

In the Make a Call menu, select the streaming icon and press the OK key on the remote control...

Select Streamer Settings and press the OK key again...

The Streamer Settings will now be displayed...

The streaming settings
Address. This is defined as the IP-address of a streaming client, streaming server or a multicast address. Giving an address in the range 224.0.0.1–239.255.255.255 will broadcast the stream to any host that has joined the specified multicast group. Specifying normal broadcast address 255.255.255.255 will broadcast to any members on the LAN.

Address Port. If several codec’s are streaming to the same IP-address, different ports have to be used in order for the client to know which stream to receive. If the first codec streams on port 2240 and the second codec on port 2250, the client has to specify which port to listen to. Video is transmitted on the specified port; audio is transmitted on the port number 4 greater than the specified video port, in this case 224444 and 2254.

TTL/Router Hops. This is used for streaming data to limit how many routers the data should pass before it is rejected. If TTL is set to 2, data will not traverse more than 2 router hops.

Streaming Source. The source used for streaming.
Auto: Enables streaming of both local and far end video. Selection of which site to be streamed is done using voice switching (the site that speaks is streamed).
Local: Only the local video will be streamed.
Remote: Only the far end video will be streamed.
Local and far end audio is always streamed.

Password. Set password so that only participants entering correct password will be able to view the streaming session. Entering a password will prevent unauthorized people from accessing the streaming session.

Allow Remote Start. Define whether remote start is allowed.
On: Streaming can be started from external user interfaces like the Web-browser or Telnet session.
Off: Streaming can only be started from the Video Conferencing System User Interface using the remote control, or by using the Data port. This will prevent activation of streaming using Web browser or Telnet sessions.

Announcements. Define whether announcement packet should be sent.
On: The codec will send announcement packets to the network that it is streaming. This enables a streaming client (e.g. a PC) to connect to the codec’s streaming session. Used by Cisco IP/TV.
Off: No announcement packets will be transmitted.

Video Rate. Defines the Video streaming rate from the system. Range is 16–320 kbps. In addition, audio (G.711) streaming rate is 64 kbps, providing a maximum streaming rate of 384 kbps.

Password. Set password so that only participants entering correct password will be able to view the streaming session. Entering a password will prevent unauthorized people from accessing the streaming session.
Streaming (II)
Streaming lets you broadcast your meeting to participants on the web. The web participants can view the meeting, listen to the meeting, see snapshots, but not participate themselves. How to set up for streaming is described on the previous page.

Streaming a video meeting...

Whilst in a call, press the green Call key on the remote control and navigate to Streaming...

Press the OK key to produce the Streaming submenu. Navigate to Start Streaming and press the OK key...

During streaming the Start Streaming icon will change to Stop Streaming. Select this icon and press the OK key to stop streaming. Ending your call will also halt the streaming.

Viewing the streamed content
After streaming is started, an easy way to view the streamed audio/video on your PC, is to start your web browser and enter the IP-address of the streaming system.

Once the web page of the system is shown, click on Streaming. Alternatively, enter http://codec/ip-address>/showstream.ssi.

If in doubt, consult your system administrator.
Calling two others at the same time

The MultiSite capability is an optional feature in many TANDBERG systems. This feature gives you the possibility of arranging video meetings by calling several others and have you all connected together simultaneously. For more on this, see Video conferences.

Video systems not equipped with MultiSite may still call another party when already in a call. Thus you may even here have two calls running at the same time. Note that the two parties will not be able to communicate with each other, only with you and only one at a time. The feature requires H.323 or SIP to work.

If you are not sure whether your system has this feature, contact your system administrator.

When you make an additional call, the party called first will be temporarily suspended. The message “Please wait” will appear on the screen of the party suspended.

You may switch between the two parties you have called by navigating to the lowermost line in the main menu as shown on this page.

This feature is not available on systems with MultiSite installed.

Both calls made must be SIP or H.323 in order to make this feature work. This feature is available on non-MultiSite systems only. If in doubt, ask your system administrator.
Transferring calls

During a call you may transfer the other party to a third party and disconnect yourself from the call.

Call transfer comes in two flavors:

Consultative transfer. This takes place when you have called two parties at the same time (as discussed on the previous page) and decide that you want to connect the two, while at the same time disconnecting yourself.

Unattended transfer. This takes place when you transfer a call to someone else without already being in a video call with that party.

Consultative transfer …

Assume that you are already connected to two others at the same time—similar to what is outlined on the previous page. One or both of these may have called you. There is no requirement that any of the calls must have been initiated by you. Both calls must, however, be of SIP type.

Unattended transfer …

Assume that you are already in a call with someone. If you now call another using the method described on the previous page (Calling two others at the same time) …

Consultative transfer …

To connect the two parties together and thereby disconnecting yourself, press the OK key on the remote control to display the Call menu (which now will have a slightly different look), navigate down to the Transfer icon, and press the OK key again.

Unattended transfer …

To connect the two parties together, navigate down to the Transfer call icon and click the OK key on the remote control.

The call will now be transferred and you will be disconnected.

The call will now be transferred and you will be disconnected.

Observe that call transfer only works on non-MultiSite systems. Furthermore the feature applies to SIP calls only!

If you are in doubt whether your system is a non-MultiSite system contact your system administrator.
Video conferences

Video conferencing systems equipped with the optional built-in MultiSite can handle several video calls and telephone-only calls simultaneously. How many depends on the type of TANDBERG video system you are using.

You may set up a video meeting with many participants in advance and/or you may add participants during a conference. This is called to add another call.

Observe that the ability to add another call is an optional feature, which your system may, or may not, be equipped with.

Systems without this option will have no Add Another Call icon in the menus.

Using group entries from the phone book

If you dislike the idea of having to look up each and every party to call every time you are about to initiate a conference, you may like to know that it is possible to add group entries to the phone book.

This is a handy feature whenever you want to set up meetings with the same group frequently.

More on this can be found in Phone book usage.

In MultiSite calls (i.e. video conferences with more than two participants) the term Far End will lose its meaning since it will not be unambiguous whom we refer to. This means that some features normally available during point-to-point calls—like far end camera control—won’t be available during MultiSite calls.

If you are the one who initiated the video conference, you are considered as the host by the system.

IP and ISDN communication

Some TANDBERG systems use IP (Internet Protocol) for video communication, while others use ISDN as well as IP.

Observe that in order to be able to communicate with 3G mobile phones and to enable communication between ISDN- and IP-based systems, access to additional functionality hardware may be required.

Consult your system administrator or your TANDBERG representative for details.

How many participants are possible?

This depends on the configuration of your TANDBERG system. The larger systems have an optional built-in MCU (MultiConference Unit) opening up for 4–6 simultaneous participants plus extras on voice-only (telephone), while the smaller systems do not have this feature at all.

All systems can, however, be connected to a network containing external MCUs. These MCUs are capable of running several video conferences with many participants each, simultaneously. Read more about this on the next page.

To learn more about the actual configuration available in your system, contact your system administrator.
Adding calls to a conference

Conference systems with the optional built-in MultiSite can handle up to 4–6 video calls and up to 3 telephone calls simultaneously, depending on the system.

You may set up a video meeting with many participants in advance and/or you may add participants during a conference. This is called to add another call.

Observe that the ability to add another call is an optional feature, which your system may, or may not, be equipped with.

Systems without this option will have no Add Another Call icon in the menus.

Multiway (Beta)

However, your system may be equipped with the MultiWay (Beta) feature. This feature allows you to set up conferences with many participants from your video system.

MultiWay (Beta) enables systems with no conference option installed to run complex video conferences with many participants. For systems with built-in conference capabilities the number of participants can be expanded beyond the systems’ own maximum number of participants supported.

The MultiWay (Beta) feature requires the presence of an external MCU (MultiConference Unit), but also a TANDBERG Gatekeeper or the TANDBERG VCS. This MCU will run the conference for you, if your system does not support conferencing or if you try to expand the number of participants beyond the number supported by the system itself.

Consult your system administrator to clarify whether this feature exists in your system, if needed.

Using group entries from the phone book

If you dislike the idea of having to look up each and every party to call every time you are about initiate a conference, you may like to know that you may add group entries to the phone book.

This is a handy feature whenever you want to set up meetings with the same group frequently.

More on this can be found in Phone book usage.
Chapter 3

Phone book usage

In this chapter...
- Basic phone book features
- Searching in the phone book
- Adding new contacts
- Editing existing entries
- Creating MultiSite entries
- Editing MultiSite entries
Basic phone book features

Your TANDBERG video system contains a phone book functionality, which is very similar to what you find in a mobile phone. It contains lists of calls placed, calls missed and calls received. Furthermore, it has a section in which you can add your own list of contacts, and most corporate solutions will also include a corporate phone list.

This latter list is normally installed and maintained from remote by your system administrator through a management system like the TANDBERG Management Suite (TMS), which is available separately.

You cannot edit the corporate list yourself, but you may import any number of entries to My Contacts. Once imported they may, however, be edited ad libitum.

Changes in the corporate list made by your system administrator, will not affect the My Contacts list, so you may have to check and compare your own list to the corporate list from time to time.

Entries in My Contacts can be combined in groups, so that you can call an entire group simultaneously when you are about to be hosting a video conference.

Entering the phone book...

Press the Phone Book key on the remote control...

... or select the Phone Book icon in the Make a Call menu and then press the OK key:

This will cause the phone book to open...

Navigating in the phone book

- Basic navigation in the phone book is done in the usual way by means of the Arrow keys of the remote control as well as the OK and Cancel keys.
- When positioned at a line with a small arrowhead appended, press the OK key to go one level down. Repeat, if needed, if there are more levels.
- Whenever you are at a lower level, the uppermost line contains the option of going Back—just navigate to this field and press the OK key.

Calling an entry in the phone book

Once an entry is located, just press the OK key to have the entry inserted in the Call menu and proceed by pressing the green Call key or via the green icon in the menu as usual.
Searching in the phone book

The My Contacts may contain up to 200 entries and the entire phone book (which may include server based corporate directories) can be virtually unlimited in size. Hence, using the arrow keys as the only navigation device can easily become a cumbersome task. What to do?

Enter Quick Search by Letters. Whenever you are inside the phone book navigating in the list of entries, the numerical keypad automatically switches from 123 mode to ABC mode. To locate a specific entry, just type in the first letter as with a mobile phone. Observe that:

- You need to be within a folder in the phone book
- The quick search is made within that folder only.

If you are not sure which folder the contact resides in, you may instead use the search function outlined in the Fig. This search function searches within all the folders of your phone book.

How to open the phone book is described in Basic phone book features on the previous page.

Searching in the phone book...

Assuming that you have already opened the phone book use the Arrow keys to navigate to the Search icon and press the OK key...

Enter the search string (the entry you are looking for) and press the OK key or move down to the OK icon and press the OK.

As an example, let us consider a search for the entry Alice...

In our example the result of this search returned three entries...

... to call any of them, navigate down to the one to call and press the OK key to copy the entry to the Make a Call menu.

Returning to the alphabetical list

When a search in the phone book is made by means of the Search function, contacts matching the search text are displayed only. Navigate to the Back line and press the OK key to return to the alphabetical list.

Entering text in the search field

Example: How do I write Alice 123 in the Search input field in the phone book?

Do as follows:
1. Press the 2-key once to get an A.
2. Press the #-key once to switch between upper case and lower case letters.
3. Press the 5-key three times to get an l.
4. Press the 4-key three times to get an i.
5. Press the 2-key three times to get a c.
6. Press the 3-key twice to get an e.
7. Press the 0-key once to get space.
8. Press the 1-key three times to get a 1.
9. Press the 2-key four times to get a 2.
10. Press the 3-key four times to get a 3.
Adding new contacts

New contacts can be added manually, from the call log or by copying from the corporate phone book (if existing). New contacts can be added to My Contacts only. Other entries are entered by your system administrator.

If you do video conferencing with many participants on a regular basis, you may want to create groups of contacts to be able to call them all in one go. Groups can only be made from entries already in the My Contacts list.

Adding new contacts from scratch…

To be able to add new contacts you must have opened the phone book and be located within My Contacts…

…then navigate to the New icon…

Press the OK key and enter name and “number” of the new contact…

Specify Call type, Net, Bandwidth and Restrict (ISDN systems only), if applicable. If in doubt, consult your system administrator.

Navigate down to the OK and press the OK key to leave the menu putting changes into effect.

Or, navigate to Cancel and press the OK key to leave menu undoing any changes.

Copying from the corporate phone book

This is done in exactly the same way as when adding a new contact from any of the call logs:

- Go to where the entry to be copied resides and do as described above.

Adding a new contact from the call log

If you want to add an entry directly from any of the call logs, do as follows:

1. Go to the log, in which the entry to be added resides.
2. Navigate to that particular entry.
3. From that entry navigate left and down to the New icon.
4. Press the OK key and the entry will now be stored in My Contacts.

Once you have selected the entry to be added to My Contacts, move to this icon and press the OK key.
Editing existing entries

You may edit and delete entries in My Contacts any time. Since updates in the corporate phone book(s) made by your system administrator will not affect My Contacts, you may have to use this feature from time to time when corporate phone book changes are made. Observe that you cannot edit any other parts of your phone book except the contents of your call logs, all of which entries can be copied to My Contacts (as described on the previous page) or they can be discarded.

Editing an entry…

Editing can only take place among entries in My Contacts. Start by selecting the entry to edit…

…then navigate to the left and down to the Edit icon and press the OK key…

Edit the contact…

Navigate down to the OK and press the OK key to leave the menu putting changes into effect.

Or, navigate to Cancel and press the OK key to leave menu undoing any changes.

Discarding an entry

Entries in My Contacts and in any of the call logs may be discarded at any time.

Do as follows:

1. Go to where the entry to be discarded resides, this can only be one of the call logs or My Contacts.
2. Navigate to that particular entry.
3. From that entry navigate left and down to the Delete icon:

Once you have selected the entry to be discarded, move to this icon and press the OK key.

4. Press the OK key and the following dialog box will appear:

5. Press the OK key to leave the menu putting changes into effect or navigate to Cancel and press the OK key to leave menu undoing any changes.

Discarding the entire call log

You may discard the entire call log by entering into either Placed Calls, Missed Calls or Received Calls. Navigate down to one of the entries and then navigate left as described in Discarding an Entry above.

You will now see that there are two types of Delete icons here:
- The Delete-a-single-entry icon:
- The Delete-multiple-entries icon:

If you navigate down to the Delete-multiple-entries icon and press OK you will be prompted to confirm that you want to delete all call log entries. If you do so, all entries in Placed Calls, Missed Calls and Received Calls will be discarded! To avoid this, select entries to be discarded one by one!
Creating MultiSite entries

Assume that you frequently use your video system to set up MultiSite video meetings involving the same persons every time.

Wouldn’t it be nice to be able to set up the video meeting with just a few clicks?

Enter MultiSite Contacts: You may assign contacts already in your phone book to a MultiSite group. This group will in turn form a MultiSite Contact.

When setting up a video conference, all members of a particular MultiSite Contact will then be connected automatically, so you won’t have to call them one by one!

My Contacts can hold up to 50 MultiSites Contacts. Entries in My Contacts can be members of as many groups as you like.

MultiSite contacts can only be recruited from My Contacts.

MultiSite Contacts is an optional feature, which may or may not be installed on your system. Contact your system administrator or your TANDBERG representative for details.

The exact number of simultaneous video and telephone participants your TANDBERG video system actually supports is configuration dependent, i.e. whether you depend on your system’s built-in MultiSite capabilities, and whether additional infrastructure products like external MCUs are available. If in doubt, contact your system administrator.

1. Open My Contacts as described on the previous pages…

2. Navigate to the Create MultiSite Contacts icon…

3. Then press the OK key to open the MultiSite dialog box…

4. Enter a descriptive name for the group…

5. Navigate down to the first line below the Name field…

6. Press the OK key to show the contents of the My Contacts, allowing you to choose participants…

7. Press the OK key to have your selection inserted in the MultiSite Contact list…

8. Move down to the next Add Participant and repeat the procedure until you have added the participants you want to add…

9. Once all the participants have been added, move down to OK and press the OK key to leave the menu putting changes into effect.
Editing MultiSite entries

MultSite entries can be viewed to inspect whom the participants of the group are, in addition any number of the participants may be replaced or removed and finally any MultiSite entry may be deleted at all times.

To edit the participants of a group …

Within My Contacts, select the MultiSite entry to be edited and use the Arrow keys to move to the left and then down to the Edit icon, as shown here.

Press the OK key.

Move to the member of the group to be edited using the vertical Arrow keys. Use Cancel to delete a member leaving the position empty and OK to change to another member.

Viewing who is part of a MultiSite entry

To view who is part of a certain MultiSite entry, move to that specific entry in My Contacts and press the OK key.

Deleting a MultiSite entry

To delete an entire MultiSite entry, navigate down to that entry in My Contacts and do as described in Discarding an entry in this chapter of the user guide.
Chapter 4

Video meeting features

In this chapter...
► Using near end and far end camera controls
► Using camera presets
► Running presentations
► Dual video streams
► Snapshots
► Controlling far end video sources
► Text chatting in video calls
Using far end camera control

This is a feature that lets you pan, tilt, and zoom the far end camera. If far end presets are available you may access these as well. This feature requires an electrically movable camera at the far end—i.e. communication between e.g. two TANDBERG 1700 MXP units will not provide far end camera control since the camera on this model is subject to manual movements only.

This feature is not accessible in MultiSite video meetings, since the term far end will lose its meaning when there are more than two parties in a call.

1. While in a call, press the OK key to produce the main menu and then navigate to the Camera Control icon...

2. Then press the OK key and navigate to the Far End tab to control the far end camera and to the Near End tab to control your own camera...

3. Now, navigate down to the Camera Control icon of the selected tab to prepare to control the camera (Far end is used in this example)...

4. Press the OK key to enable the camera control. Four arrowheads will now appear...

5. The four arrows indicate which Arrow key to use on the remote control to move the Far End camera to the left, right, up, and down.

If you want to control the other camera, go back up to the tabs and use horizontal Arrow keys to move between tabs.

Use the Zoom keys on the remote control to zoom in and out.

Navigate to here and press the OK key to exit the Camera Control mode as such.

Using near end camera control

Provided that your own video system has a camera that can be controlled from the remote control, you may, of course, just as well control your own camera during a call.

To utilize near end camera control:
- Do as described in the Figs 1–5, but be sure to select the Near End tab in Fig. 2 instead.

This feature is always accessible, irrespective of whether you are in point-to-point calls or in MultiSite calls.
Using far end camera presets

The far end may use camera presets to easily vary between predefined camera angles in their own end. Thus they eliminate the need to move their camera about in a manual way.

Your video system may get access to these settings. If no presets have been stored and you try to access far end presets, nothing will happen.

This feature is not accessible in MultiSite video meetings, since the term far end will lose its meaning when there are more than two parties in a call.

Using near end camera presets

If your system supports camera presets, you may define such presets in advance, see Camera presets for more on this.

The advantage of using camera presets lies primarily in the ability to have the camera jump directly to a predefined angle and focus.

If you assign a preset to every person’s physical position, you may switch between these views as people talk in order to provide a close-up of the person talking.

Some meeting rooms include a whiteboard. Assigning a preset to show the whiteboard will save time and effort every time the white board is used for a presentation.

To utilize your near end presets:

- Do as described in the Figs 1–5, but be sure to select the Near End tab in Fig. 2 instead.

This feature is always accessible, irrespective of whether you are in point-to-point calls or in MultiSite calls.

In a call, the numerical keypad of the remote control can be used to access the 9 first presets directly. Just push the corresponding numerical key. This will not work if you are in a menu expecting alphanumeric entries.
Running a presentation

The presentation functionality in the system enables you to show other available video sources in addition to your main camera. This is perfect for meetings where you would like to show a PowerPoint presentation, for example. You can even use Arrow keys up and down on the remote control to activate Page Up/Down on the PC (this applies when using VN only).

You can also use the presentation feature outside a call to make a local presentation for the people in your own meeting room and when you are in a call use it to make a presentation for the far end as well. The quickest way to show a presentation is to use the Presentation key on the remote control. Pressing the Presentation key causes a predefined video source to be shown, PC is the default.

You may change the presentation source in the Presentation menu. Choose Presentation from the main menu if you want to select a video source manually. The Presentation menu offers you all the available video sources supported by your system. The number of sources that can be connected varies with the type of video system you have.

The default setting (marked by a green ring) can be set in the Control Panel by your system administrator. Note that this setting may be password protected.

Use dual video stream if you can!

Video systems equipped with the optional dual video stream provides the opportunity to show two different live video streams simultaneously, main video and one additional source. This is handy when showing a presentation. You will then let the others see the live presentation along with the live video of the presenter—simultaneously.

If in doubt, consult your system administrator to find out if your system has this capability.

More on this can be found on the following page.

Not all systems have all choices

The larger video systems have all the presentation source choices available, while the smaller systems have a subset only.

The following list applies:

- TANDBERG MAESTRO MXP
- TANDBERG TACTICAL MXP
- TANDBERG 3000 MXP
- TANDBERG 6000 MXP
- TANDBERG 8000 MXP
- TANDBERG 770/880/990 MXP
- TANDBERG 75/85/95 MXP
- TANDBERG 1000 MXP
- TANDBERG 1700 MXP
- TANDBERG 550 MXP

You may now make your choice. Once made, press the OK key to exit the menu, putting changes into effect. The system will now be in Presentation mode.

This menu shows how it looks for a fully equipped system. Your system may have less options—see text for details.
Dual Video Stream

Video systems equipped with the optional dual video stream provide the opportunity to show two different live video streams simultaneously, main video and one additional source. This is handy when showing a presentation. You will then let the others see the live presentation along with the live video of the presenter—simultaneously.

When you start a presentation, the second stream starts automatically if both local and remote systems support dual stream. If one of the systems does not support dual stream, no second video stream will be established and your presentation will be shown as your main video instead.

In a MultiSite meeting, dual stream will be established if at least two systems support it. Those not supporting it will get no second stream! They will, however, see the presentation, but nothing else.

No dual video stream?
The dual video stream ability is an optional feature, but available as retrofit. Contact your system administrator or your TANDBERG representative for details.

Dual stream and bandwidth

When using dual stream, the quality automatically downsamples to the optimal bandwidth. This means you need higher quality to allocate enough bandwidth for the two video streams. The second stream borrows bandwidth from the main video stream. When second stream is closed, the bandwidth is returned to the main video.

Note that when selecting the document camera or PC, the system will automatically request floor when connected to an MCU conference as MultiSite host or when connected to an external MCU.

Your administrator may specify the amount of bandwidth allocated to presentations. If you frequently run video presentations, you may want to have a higher bandwidth than if you stick to static Powerpoint presentations.

This setting can be adjusted in the Control Panel by your system administrator. Note that this setting may be password protected.

Connect your presentation source to your video system...

1. Connect your presentation source to your video system...

2. Press the Presentation key on the remote control and hold it for a second...

   …or navigate to the Presentation icon in the main menu and press the OK key...

3. The Presentation menu will now be displayed. Navigate to the DuoVideo tab and then down to the source to be used for your second stream presentation.

4. You are free to choose whether the second stream shall be your camera or your presentation, in other words you are free to choose which source shall play which role.

5. Here is an example showing dual stream used in a MultiSite meeting with three participants and a presentation...

6. End the dual video presentation by pressing the Presentation key again.

This icon appears to show that dual video stream is active.
Snapshots

The system can take a snapshot of your live video. Snapshot is handy when you are in a call with a system that does not support dual video stream. Use the snapshot feature to show a snapshot of your presentation and continue the meeting with main camera.

Your video system can send snapshots in a point-to-point video meeting only, sending snapshots in MultiSite meetings is not supported.

The following should be observed:

- When displaying a snapshot, it will always be the latest snapshot taken that is displayed, regardless of which end (near or far) took it.
- Any snapshot taken is deleted once the call is terminated.
- The snapshot feature uses H.261 Annex D. Consequently it will fail to work when using H.264 video compression.

Taking a snapshot using the menu...

In a call, press the OK key to produce the main menu and navigate to the Presentation icon...

... then press the OK key to display the Presentation menu. Navigate to the Snapshot tab and then down to the Take New Snapshot icon. Press the OK key to take a snapshot and send it to the far end.

Displaying a snapshot...

In a call press the OK key to produce the menu line, if needed, and navigate to the Presentation icon...

... then do as above, but select Display Snapshot instead. Press the OK key to display the snapshot.

Taking a snapshot using the remote control

In a point-to-point call press the Snapshot key (the * key).

If the Number Key Settings menu has been set to Touch Tones, pressing the Snapshot key will not be interpreted as snapshot, but as a touch tone.

The Number Key Settings must have been set to something else to make the key work as a Snapshot key. This is done in the Control Panel of your system. Your system administrator may have password protected this area.

Likewise, this will not work when you are in an input field requiring numerical or text entries. The * will then be interpreted as just *.
Controlling far end video sources

In point-to-point video calls your system may be connected to a far end system with several inputs for various video sources. You may actually get access to these by means of the far end video controls.

Your system can access the inputs only. The far end may have connected other sources to the inputs than the input names normally should suggest.

When the far end system is a TANDBERG system both parties will be notified when one party tries to access one of the video sources of the other party. This may, or may not, take place with systems from other vendors as well.

A text will be displayed for some seconds at the top of both parties’ screen indicating the input source accessed. Example: PC.

If you display the other party in full screen, this will be the only indication you get when the other party is accessing any of your video sources.

If you set the screen to display both parties you will see what the other party sees, since both incoming and outgoing video are displayed on your screen.

This feature is not accessible in MultiSite video meetings, since the term far end will loose its meaning when there are more than two parties in a call.

Accessing the far end video sources

Being in a call, press the OK key to produce the main menu. Then do as follows:

1. Navigate to the Presentation icon and press the OK key.

2. Navigate to the Far End Video tab and then navigate down to the icon corresponding to the source whose contents you would like to have displayed on your screen.

Not all system have all choices

The larger video systems have all the presentation source choices available, while the smaller systems have a subset only.

The following list applies:

- TANDBERG MAESTRO MXP
- TANDBERG TACTICAL MXP
- TANDBERG 3000 MXP
- TANDBERG 6000 MXP
- TANDBERG 8000 MXP
- TANDBERG 770/880/990 MXP
- TANDBERG 75/85/95 MXP
- TANDBERG 1000 MXP
- TANDBERG 1700 MXP
- TANDBERG 550 MXP

What is VNC used for?

Imagine you want to present contents residing on a PC located elsewhere. You may then use an application known as PC SoftPresenter to display PC images on your system without using a VGA cable (PC Presenter). The system and your PC must be connected to the same LAN. In addition, VNC (Virtual Network Computing) server software must be installed on your PC.

Free software can be downloaded from http://www.realvnc.com. Install the software by running the downloaded file.

This is an optional feature—contact your system administrator or your TANDBERG Representative for details.
Text chatting in video calls
You may use your video system to send and receive text messages using the chatting function available.
All you need to do is to select the Text Chat function and use the keypad as you would when sending text messages (SMS) using your mobile phone.

Once you enter Text Chat mode, the dialog box expects alphanumerical entries via the remote control.

This will not work unless the far side a) supports text chat, and b) has activated that feature.

Text chatting applies to point-to-point video meetings only.

1. In a call press the OK key to display the menu and navigate to Services.

2. Navigate to the Text Chat icon.

3. Press the OK key and start your text chatting by pressing the keys on the remote control.

4. Press the OK key to end the chat and return to the Services menu.

Using the number keys in text fields
Whenever text entries are expected by the system, a small abc or ABC appears in the right lower corner of the entry field. For entry fields expecting numbers, 123 will appear instead. In text mode, entries from the number keys are automatically interpreted as text entries in the same way as on a mobile phone.

Guidelines:
- Press the key that corresponds to the required letter as many times as needed to produce that letter.
- Switch between lower case (abc) and upper case (ABC) letters with the # a/A key.
- Switch between text mode (abc) and number mode (123) by keeping the # a/A key depressed for more than a second.
- To insert space, press the 0 _ key.
- To insert the @ sign, press the 1 -key twice, while the keypad is in text mode.
- To insert the . sign, press the *,key once, while the keypad is in number mode.
- To write digits and numbers in a text input field, repeatedly press the corresponding key until the digit appears.
Chapter 5

Video conferencing features

In this chapter...
- About video conferencing
- Requesting and releasing floor
- Assigning the floor to others
- Image layout
- Terminal names
About video conferencing

A video call involving more than two participants is called a video conference or a MultiSite call. A multitude of TANDBERGS video endpoints are capable of initiating video conferences. To be able to do this the endpoints must have a built-in MCU (Multipoint Control Unit). This is an optional feature that may, or may not, be installed in your video endpoint.

Some video endpoints are without this optional built-in feature. They can, however, participate in video meeting initiated by others.

Observe that the infrastructure of your video network may contain external MCUs. These are devices dedicated to handle several simultaneous video conferences, each with many participants. Consult your system administrator for information on how to utilize external MCUs, if applicable.

Who becomes the host?

The host of a video conference is the endpoint to which all the others are connected. In other words, the one that initiated the conference.

If two systems both supporting MultiSite have established their own video conference independent of the other and one of these two call the other, cascading will take place. This means that you may have more participants in total than a single system supports. In this case, the host will be the one calling the other.

The host has the right to terminate the connection to any of the participants. The participants cannot control any of the others, but may disconnect themselves from the meeting at all times.

In MultiSite calls (i.e. video conferences with more than two participants) the term far end will lose its meaning since it will not be unambiguous whom we refer to. This means that some features normally available during point-to-point calls—like far end camera control—won’t be available during MultiSite calls.

Request, release, and assign floor

When you ➤ request the floor, your video will be broadcasted in full screen to all other participants in the conference. Request floor is useful when you want to speak or display something in front of all the other participants.

Similarly, you may ➤ release the floor when you are done and make the floor available to other participants in the conference. An indicator appears when you have the floor and disappears once you release it.

If your system is the one who initiated the meeting, you will be the host of the meeting and you will then be able to ➤ assign the floor to others.

Split screen and voice switching

In order to be able to see all the participants all the time, the screen may be set in Split Screen mode, dividing the screen into several images. When set up for ➤ voice switching the system will give priority to the participant speaking loudest.

Layout

When you are the host of a video conference, you have control of the ➤ main conference image layout. The layout chosen by you is transmitted to the other participants as a single image and its layout cannot be changed by them. However, they may configure their own screen using the Layout button on the remote control. Their choices are the image you send out in full screen, or in a side-by-side layout—your image and their selfview.
**Request and release floor**

When you request floor, your video will be broadcasted as the large picture to all other parties in the conference. Request floor is useful when you want to speak or display something in front of all participants.

Select Release Floor and press the OK key when you are done to make the floor available for other parties in the conference.

An indicator appears in the upper right corner when you have the floor and it disappears when you release floor.

**Assigning floor**

If your system is the one connected to all the other systems, you will be the host of the meeting and you will be able to assign the floor to others.

1. In the main menu, navigate to Services and press the OK key...

2. Navigate to the Request Floor icon and press OK to request floor...

3. Once you have the floor, the icon changes to Release Floor. Press OK to release floor again.

**Automated jumping to full screen**

You may have your system administrator set up the system to switch to full screen each time someone requests the floor.

This is done in the Control Panel—see Floor to Full Screen in Settings > Video. More information on this can be found in the Administrator Guide on the CD accompanying your video endpoint.

Observe that you may not have access to these settings, as they may have been password protected by your system administrator.

1. Navigate to the Services submenu in the same way as when requesting floor (above)...

2. Navigate to Assign Floor and press OK.

3. Select whom to assign floor to and press OK.
**Layout**

When you are the host of a video conference, you have control of the main conference image layout. The layout chosen by you is transmitted to the other participants as a single image and its layout cannot be changed by them. However, they may configure their own screen using the Layout button on the remote control. Their choices are the image you send out in full screen, or in a side-by-side layout—your image and their own selfview.

### Setting the display layout…

1. In the main menu, select the Services icon and press the OK key…

2. In the submenu, navigate to the Layout icon and press the OK key…

3. Select your preferred Layout option and press the OK key.

### The layout options available

There are altogether four layout options available:

- **Auto Split** will give you the best screen layout given the number of participants:

  ![Auto Split](image)

- **4-split** divides the screen into four images of equal size:

  ![4-split](image)

- **5+1** provides 1 large and 5 smaller images:

  ![5+1](image)

- **Voice switched** will cause the participant speaking loudest to get the floor in full screen:

  ![Voice switched](image)
Terminal names

You may want to see a list of all the participants in a video conference. For this purpose there is a list of the terminal names available.

1. In the main menu, select the Services icon and press the OK key...

2. In the submenu, navigate to the Terminal Names icon and press the OK key...

3. The list of terminal names will now be shown.
